

CS 7265- Homework 1

In HW1, we will implement decision tree for training a decision tree model (from training data) and classifying new data (test data).

You are given two data sets: [car.training.csv](#) and [car.test.csv](#), where “car.training.csv” is a training data that you will induce a decision tree model from, and “car.test.csv” is a test data that you classify with the trained decision tree model.

You can find the data description at <https://archive.ics.uci.edu/ml/datasets/Car+Evaluation>, but have to use the given simplified data sets (all classes are equally distributed).

For this homework assignment, please follow the procedure:

1. Make a decision tree by using one of GINI index, Information Gain (or Gain Ratio), or misclassification errors. You can also compare the performances of the three approaches (strongly recommended, but not required).
2. Show your decision tree model as a figure. You can manually draw the tree, but recommended to (automatically) construct the decision tree using the data structure of TREE in the script language.
3. Show the accuracy of your decision tree. For accuracy, you have to use the given test data. The test data includes class labels (acc vs unacc), so you check whether your prediction is correct or not. Then you can compute accuracy by:

$$\text{accuracy} = \frac{\text{\# of your predictions which are correct}}{\text{\# of total test data}}$$

4. You can convert the ordinal data to numerical data for simplicity's sake. (but it may not give the optimal performance)
5. **You CANNOT use library or built-in functions of decision trees. You have to implement it.**

You have to submit the followings to D2L:

1. MS word file
 - Describe what you have done for the homework assignment.
 - Include the decision tree model as a figure.
 - Include the accuracy that you got with your decision tree.
2. Source code file(s)
 - Any languages, but recommend R or Python
 - Must be well organized (comments, indentation, ...)
 - You need to upload the “original R or python file (*.r or *.py)” and also its “PDF” version.
 - o For the PDF file, you can just convert the source file to PDF. One way is to print the source file and save to “PDF”.

You have to submit the files SEPERATELY. DO NOT compress into a ZIP file. If you fail to provide all required information or files, you may be given zero score without grading.

Deadline:

The deadline for HW1 is **11:59pm Wednesday, September 12, 2018**. Late assignments will be accepted up to 24 hours after the due date for 50% credit. Assignments submitted more than 24 hours late will not be accepted for credit.

This is an example of the outcome. Fig. 1 shows the message how the model constructs during the training process, and Fig. 2 is the result with the test data. Fig. 3 illustrates the optimal decision tree trained with the training data.
